

# Ve 280

## Programming and Elementary Data Structures

### **Linux**

#### **Learning objectives:**

Learn how to navigate the directory tree

Learn how to manipulate files/directory

Understand I/O redirection

And a few other useful commands (diff, apt-get...)

# Unix

- An operating system supporting multitasking and multi-user
- Developed in 1969 by Ken Thompson, Dennis Ritchie, etc. from AT&T Bell Labs
- Many variants (Unix-like OS)
  - Linux
  - BSD (from UC Berkeley)
  - Solaris (from Sun Microsystems)
  - Android (from Google)
  - iOS (from Apple)
  - ...

# Linux

- A free and open source Unix-like operating system
- First released in 1991 by Linus Torvalds
- Many distributions
  - Gentoo
  - Red Hat
  - Ubuntu
  - ...

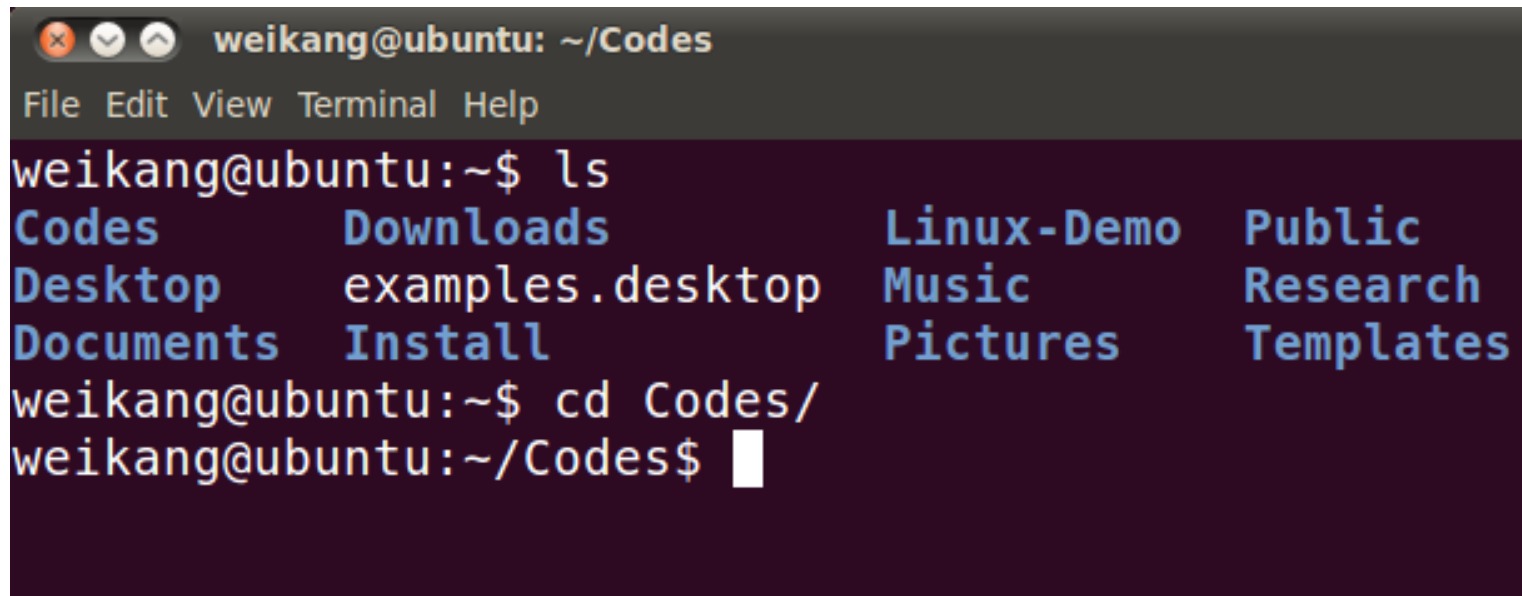

# Installing Linux

- Recommended version: **Ubuntu**
  - You can get the .iso file from:  
<http://www.ubuntu.com/download/desktop>
  - Suggest to use the latest version.
- Install it directly on your machine
- OR install it on a virtual machine on your Windows/Mac operating system.
  - Install a virtual machine such as VirtualBox  
(<https://www.virtualbox.org/>) or VMware Workstation  
(<http://www.vmware.com/>) first.
  - SJTU provides free download of VMware Workstation at the link: <http://vmap.sjtu.edu.cn/>

# Using Terminal in Linux

- We type commands in the terminal in Linux

The screenshot shows a terminal window titled "weikang@ubuntu: ~/Codes". The window has a menu bar with "File", "Edit", "View", "Terminal", and "Help". The terminal content shows the user running the "ls" command in the home directory, which lists various folders and files. The output is as follows:

```
weikang@ubuntu:~$ ls
Codes          Downloads      Linux-Demo    Public
Desktop        examples.desktop Music          Research
Documents      Install       Pictures      Templates
weikang@ubuntu:~$ cd Codes/
weikang@ubuntu:~/Codes$
```

- Multiple ways to start a terminal
  - One simple way is to right click and choose from the shortcut menu

# Change Directory

- Basic command: `cd pathname`
  - E.g., `cd /usr/bin`  
typical path name format
- Special characters for directories
  - root directory: `/`
  - home directory: `~`
    - Linux is a multi-user operating system. It is your “home directory”.
  - current directory: `.`
  - parent directory: `..`

# Aside: Root Directory

- Directory in Linux is organized as a tree
- The topmost directory is root directory “/”

# List Contents of a Directory

- Basic command: `ls directory`
  - e.g., `ls /home`
- `ls` (i.e., “`ls`” alone): list the current working directory

## Options

- `ls -l [directory]`: list in long format
- `ls -a [directory]`: list all files including the hidden files
  - Hidden files: file name begin with a dot, e.g., “`.bash_history`”
- In Linux, options can be combined together.
  - “`ls -la`” or “`ls -l -a`”

# Aside: Long Format of File Information

- `ls -l`

group                      modification time

-rw-----	1	john	john	576	Apr 17 1998	weather.txt
drwxr-xr-x	6	john	john	1024	Oct 9 1999	web_page
-rw-rw-r--	1	john	john	276480	Feb 11 20:41	web_site.tar
-rwx-----	1	john	john	5743	Dec 16 1998	my_app

permission

owner

file size  
(in bytes)

file name

- File permission
  - First character: '-' regular file; 'd' directory
  - Next three: read, write, execution permission of the owner
  - Next three: read, write, execution permission of the group
  - Final three: read, write, execution permission of everyone else

# Manipulating Files/Directories

- Create directories: **mkdir** dir
- Delete directories: **rmdir** dir
  - Can only remove **empty** directory
- Create an empty file: **touch** file

# Copy Files/Directories

- Basic command: `cp source dest`
- Variations
  - `cp file1 file2`: copy the content of file1 into file2
  - `cp file1 dir`: copy file into a directory
    - `cp file1 file2 dir`
    - `cp file* dir`
      - \*: wildcard. Can represent any character string (even an empty string!)
  - `cp -r dir1 dir2`: If dir2 does not exist, copy dir1 as dir2. If dir2 exists, copy dir1 inside dir2

# ? Which Commands List ALL Files with the xyz Extension in Current Folder?

Assume no hidden files. Select all the correct answers.

- A. `ls ./*xyz`
- B. `ls *.xyz`
- C. `ls *xyz`
- D. None of the above.

# Rename/Move a File

- Basic command: `mv source dest`
- Variations
  - `mv file1 file2`: rename file1 as file2
  - `mv file1 dir`: move file into a directory
  - `mv dir1 dir2`: If dir2 does not exist, then rename dir1 as dir2. If dir2 exists, then move dir1 inside dir2

# Delete Files/Directories

- Basic command: `rm file`
- Variations
  - `rm file`: delete file
  - `rm file1 file2`: delete file1 and file2
  - `rm -r dir`: delete dir along with its contents
- Useful options `-i`: prompt before every removal
  - To use: alias `rm='rm -i'`;
  - Put it into `~/.bashrc`

# Edit/Show a File

- Edit file: `nano file`      `gedit file`
  - advanced editor: vim, emacs
- Show file content
  - `cat file`
  - `less file`
    - quit 'less': press 'q'
    - go to the end: press 'G' (shift + g)
    - go to the beginning: press 'g'
    - search: press '/', then enter the thing to be searched
    - press 'n' for the next match; press 'N' for the previous match.

# I/O Redirection

- Most command line programs display their results on the **standard output**.
  - By default, standard output is our display.
- We can redirect from standard output to a file by using '>'.
  - E.g., `ls -l > ls_rst.txt`: the “ls” result is now in `ls_rst.txt`

# I/O Redirection

- Many commands can accept input from a facility called **standard input**.
  - By default, standard input is our keyboard.
- We can redirect standard input from a file instead of keyboard by using '<'.
  - One application: testing
  - E.g., `my_add < input.txt`  
# my\_add is a program taking two inputs from keyboard and output their sum on screen

# What does the Following Command Do?

```
sort < fruit.txt > my_favorite.txt
```

Select all the correct answers.

- **A.** The command reads fruit.txt and my\_favorite.txt
- **B.** The command reads fruit.txt and writes in my\_favorite.txt
- **C.** The elements of fruit.txt are in alphabetic order
- **D.** The elements of my\_favorite.txt are in alphabetic order

# Other Commands

- Auto completion: type a few characters; then press ‘Tab’
  - If there is a single match, Linux completes the remaining.
  - If there are multiple matches, hit the second time, Linux shows all the possible candidates.
- Compare two files: `diff file1 file2`
  - If files are the same, no output
  - If there are differences: lines after “<” are from the first file; lines after “>” are from the second file
  - In a summary line: ‘c’: change; ‘a’: add; ‘d’: delete
  - Useful option “-w”: ignore white spaces (space, tab)

# Other Commands

- Install a program: `sudo apt-get install program`
  - E.g., `sudo apt-get install emacs`
  - `sudo command`: execute command as a superuser
    - Requires you to type your password
- Remove a program: `sudo apt-get autoremove program`
- Looking for help? `man command` e.g., `man ls`
  - Browse the manual using the same commands as for 'less'
