

VE230 Homework 4

2021 Summer

P1 The upper and lower conducting plates of a large parallel-plate capacitor are separated by a distance d and maintained at potentials V_0 and 0 , respectively. A dielectric slab of dielectric constant 6.0 and uniform thickness $0.8d$ is placed over the lower plate. Assuming negligible fringing effect, determine

- the potential and electric field distribution in the dielectric slab,
- the potential and electric field distribution in the air space between the dielectric slab and the upper plate,
- the surface charge densities on the upper and lower plates.
- Compare the results in part (b) with those without the dielectric slab.

P2 Prove that the scalar potential V in

$$V = \frac{1}{4\pi\epsilon_0} \int_{V'} \frac{\rho}{R} dv'$$

satisfies Poisson's equation,

$$\nabla^2 V = -\frac{\rho}{\epsilon}$$

P3 A point charge Q exists at a distance d above a large grounded conducting plane. Determine

- the surface charge density ρ_s ,
- the total charge induced on the conducting plane.

P4 A very long two-wire transmission line, each wire of radius a and separated by a distance d , is supported at a height h above a flat conducting ground. Assuming both d and h to be much larger than a , find the capacitance per unit length of the line.

(a) A cross-sectional view.

Figure 1: Fig. 1 An Off-center Wire within a Tunnel (Problem 5)

P5 A long wire of radius a_1 lies inside a conducting circular tunnel of radius a_2 , as shown in Fig. 1. The distance between their axes is D .

- Find the capacitance per unit length.
- Determine the force per unit length on the wire if the wire and the tunnel carry equal and opposite line charges of magnitude ρ_ℓ .

P6 Two dielectric media with dielectric constants ϵ_1 and ϵ_2 are separated by a plane boundary at $x = 0$, as shown in Fig. 1. A point charge Q exists in medium 1 at distance d from the boundary.

Figure 2: Fig. 2 Image charges in dielectric media (Problem 6)

- Verify that the field in medium 1 can be obtained from Q and an image charge $-Q_1$, both acting in medium 1 .
- Verify that the field in medium 2 can be obtained from Q and an image charge $+Q_2$ coinciding with Q , both acting in medium 2 .
- Determine Q_1 and Q_2 . (Hint: Consider neighboring points P_1 and P_2 in media 1 and 2, respectively, and require the continuity of the tangential component of the E-field and of the normal component of the D-field.)

P7 An infinite conducting cone of half-angle α is maintained at potential V_0 and insulated from a grounded conducting plane, as illustrated in Fig. 2. Determine

- the potential distribution $V(\theta)$ in the region $\alpha < \theta < \pi/2$
- the electric field intensity in the region $\alpha < \theta < \pi/2$
- the charge densities on the cone surface and on the grounded plane.

Figure 3: Fig. 3 An infinite conducting cone and a grounded conducting plane (Problem 7).
